How Site Server fits in

At the heart of Microsoft Site Server is the Order Pipeline, which provides a framework for processing orders. The pipeline is an open architecture which means each stage in the order process can be handled by third party components (see page 40 for a list of those currently available). Site Server itself integrates with Windows NT Server, Internet Information Server, Microsoft Transaction Server and SQL Server to provide a flexible eCommerce platform, and with wallet software on the client side for automatic payment.
